DETAILED ACTION

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Michael A. Co field (Reg. No. 54,630) on July 8, 2008; Agreed to amend in the last line of claim 1, by incorporating the claimed limitation of claim 2, that is "adding a waiting time to shift signal based at least in part on the period of transfer signal" in the last line of claim 1, and also agreed to cancel claim 2..

Reasons for Allowance

2. The following is an examiner's statement of reasons for allowance: In response to the final Office action mailed on 04/18/08, applicant's amendment and remarks filed on 06/18/08, have been carefully reviewed and respectfully considered.

As discussed in the above indicted examiner's amendment, applicant has agreed to the examiner proposal to amend claim 1, to include the limitation of claim 2, and to cancel claims 23-28, in order to make the application in condition fro allowance.

Claims 9-15, 29-40 were allowed as indicated in the last final Office action. Claims 2 and 23-28 are currently cancelled by examiner's amendment. Claims 8, 16-22 were previously cancelled. Claims 1, 3-7, and 9-15 and 29-40 are currently pending, and are allowed for the reasons discussed below:

Specifically, with respect to claim 1, 3-7, the prior art the prior art searched and of record neither anticipates nor suggests a method of transferring image information from a scanning apparatus, the method comprising: providing a transfer signal to an image extraction device in the scanning apparatus, the image extraction device coupled to a computer; transmitting data for each pixel of a scan line to the computer via a shift signal without storing the data in a memory buffer of the scanning apparatus adjusting a period of the shift signal based at least in part on a speed of reading the data by the computer, wherein data for all of the pixels of the scan line is transmitted during a period of the transfer signal, and adding a waiting time to the shift signal based at least in part on the period of the transfer signal.

Claims 9-15 are also allowed for the reason the prior art searched and of record neither anticipates nor suggests A method of transferring image information from a scanning apparatus, the method comprising: providing a transfer signal to an image extraction device in the scanning apparatus, wherein the scanning apparatus does not include a memory buffer; transmitting pixel data for a scan line from the image extraction device to the computer via shift signal, the shift signal having a cycle time; and changing the cycle time of the shift signal from a first default cycle time to a second

different cycle time if the computer processes the pixel data using an actual processing speed that is different than an expected processing speed, the expected processing speed associated with the first default cycle time.

As to claims 29-34, the prior art searched and of record neither anticipates nor suggests an image extraction means for a timing output means for outputting a shift signal, the shift the image extraction means initiates transferring portions of the scan line to an external device; and a feedback means for detecting a rate that the external device scan line data and feeding back said detected rate to the timing signal out, wherein the timing signal output means is configured to vary the processing rate does not correspond with a transfer time for the scan line data.

Regarding claims 35-40, the reason the prior art searched and of record neither anticipates nor suggests a scanner, a light source to illuminate a document supported by a document platform; an image extraction device to provide scan line data according to an exposure time; and signal output circuitry to control transfer of the scan line data from the scanner to an external device, the signal output circuitry operable to: generate a signal having a cycle time, the cycle time of the signal controlling the frequency that the scanner initiates transfer of a portion of the scan line data from the scanner to the external device; and vary the cycle time according to a rate that the external device processes transferred scan line data.

Therefore, claims 1, 3-7, 15-28 and 29-40 are allowed for the reasons given above.

Conclusion

3. Any inquiry concerning this communication or earlier communications from the examiner should be directed to NEGUSSIE WORKU whose telephone number is (571)272-7472. The examiner can normally be reached on 9A-6PM.
